PRESS RELEASE

LYYN AB today announces its partnership with Axis Communications AB

What's happening over there in the mist? Who's approaching under cover of the snowstorm? What's actually occurring in the half-light? Good visibility is decisive in the security industry. With LYYN's patent pending V.E.T. (Visibility Enhancement Technology), visibility in poor weather conditions can be radically improved.

"Our partnership with Axis is very exciting for us. Through Axis' market dominance in network-based video surveillance we can reach out to a large amount of customers with LYYN V.E.T. Axis currently has around 400 000 video products installed and around 2500 retail partners throughout the World.

We see Axis' inclusion of LYYN V.E.T in its product portfolio as a clear confirmation of our technology's broad area of use and demonstrates its importance in the day-to-day security and surveillance business." says Fredrik Beckman, Marketing Director LYYN AB.

LYYN AB is a technology company with its roots from Lund University and Malmö University Hospital (MAS). Behind the company's technology lie many years of research within the human ophthalmic system and medical technology. LYYN's primary application areas are fixed video systems, remote control, vision support systems and surface analysis.

LYYN Visibility Enhancement Technology (V.E.T.) is a technology platform for "cleaning" digital images and video in real-time, or for processing saved material. With the help of this "cleaning" process, visibility is improved in mist and fog, snow, dust, sand, darkness, etc. visit our homepage at www.lyyn.com, and see several examples of what LyyN's technology does with still images and video clips with your own eyes.
